Connect Telegram to Inbound Surveillance

One-time setup • about 1 minute | For computers that ALREADY have Inbound Surveillance installed

What you need: a Windows computer with Inbound Surveillance already installed, the Telegram app (phone or PC), and this guide.

Follow these 4 steps

Download the file

Open your browser and go to this page:
github.com/sothunly-alt/Ibound-survillence-V2/releases
Then download the file named **Connect-Telegram.bat**.

Tip: you can also scan the QR code at the bottom.

Double-click Connect-Telegram.bat

A black window will open. The Inbound Surveillance app will close and reopen by itself. Telegram opens automatically.

In Telegram, tap START

Open Telegram (**on your phone or this PC**) and open the chat with **@Inbound_Surveillance_bot**, then tap the big **START** button.
If you don't see a START button, just send this message: **/start**

Wait for SUCCESS, then close the window

In a few seconds the black window shows **SUCCESS - Telegram is connected.** That's it — you can close it.

If Windows shows "Windows protected your PC", click **More info** → **Run anyway**. This is normal for any downloaded file — it is safe.

Didn't work? Open Telegram and search for **@Inbound_Surveillance_bot**, tap **START**, then in the app open **Integrations** and click **Connect Telegram**.
Still stuck? Send a photo of the black window (screenshot) to your installer.

Scan with your phone camera to get the file
